Bell et al's Environmental Psychology is considered to be the most authoritative textbook available for this course. It is the only environmental psychology book to appear in five editions. It is noted for its focus on the application of science and theory to the solution of problems involving natural and altered environments. The book reviews the application of practical solutions to everyday environmental problems. The authors integrate theory, research, and application using their unifying, eclectic model to demonstrate human-environment interaction. The book reviews how we are a product of our environment, our biology, and the interaction of the two. It discusses how our physical environment such as noise and weather impact us. It also reviews how we can modify our environment through design principles such as aesthetics, and how we modify our environment when we disregard the impact other people and/or elements have on our ecological system. Each chapter addresses both micro and macro- environmental influences, including the short- and long-term effects of both.

The opening chapter provides a historical context and introduces the reader to the research methods central to the discipline. The next 4 chapters introduce environmental attitudes, values, and ethics and the principles that apply to environmental assessment; models of perception & cognition, including how we process and store environmental information; and the major theories of human-environment interaction. The next 6 chapters explore a variety of environmental influences such as noise, climate, natural disasters (including the effects of pollution), crowding, and city life, and how they impact us. The next 2 chapters examine how environmental psychology principles can be applied to residences, institutional settings (i.e. schools) and work and leisure environments. The book concludes with a chapter on how we can change behavior that harms the environment. The book is intended as a text for courses on environmental psychology, environment and behavior, social ecology, architectural psychology, ecological psychology or environmental design or studies, taught in departments of psychology, sociology, environmental science, and biology.

An excellent resource for introductory environmental psych..

By Lim Ti Leong

This is an introductory book on 'Environmental Psychology'.... which features more than a normal person can imagine ..... it is NOT a book related to common sociological issues on global warming, nuclear waste disposal, environmental strikes and demonstration etc....., This book is related to psychology and features on content related to the environment and the behaviour of people. It is explained in psychological perspectives and is suitable for readers with a basic depth in understanding terminology related to psychology. There are theories on relationship between environmental and behaviour, environmental perception (such as Gestalt psych etc.) Additionally descriptions on extraneous factors of noise, temperature, barometric pressure and attitude, wind, heat and cold, physical built structures (clusters etc.), on behaviour.

Furthermore, there are chapters on disasters, Toxic Hazards and pollutions, and most interesting of all, the concepts of personal space and territorial behaviour, high density and crowding .....the effects of life in urban city in contrast to rural outback areas....theories on Architecture, Design and Engineering for Human Behaviour. Additionally topics on 'design in residential and institutional environments', 'work, learning and leisure environments', and the psychology perspective to changing people's behaviour towards saving the environment etc.,

This book is worth every penny of it.....it is worth keeping it as a resource material !

Boring book. But it came in a timely manner ...

By Married

Boring book. But it came in a timely manner and was in good condition. I expected a large text book but its a small paperback.
